SUMMARY

Software engineer with three years of experience building backend systems and LLM automation in Python and TypeScript/Node.js. Most recently built a newsletter platform that researches, writes, and sends itself daily with no human in the loop, currently 1,100 subscribers. Prior work includes a Whisper/Llama transcription pipeline, a RAG system over OpenSearch, and a computer-vision agent for device automation.

TECHNICAL SKILLS

AI/Agents: Anthropic API, OpenAI API, Gemini, Llama, function calling / tool use, autonomous agents, RAG, embeddings, vector databases, prompt engineering, LangChain, Ollama

Languages: Python, TypeScript, JavaScript, Java, HTML/CSS, Bash

Frontend/Backend: React, Next.js, Node.js, REST APIs

Automation: Puppeteer, Selenium, YOLO

Databases: PostgreSQL, Drizzle, MySQL, MongoDB, SQLite, OpenSearch

Cloud/DevOps: AWS, Docker, Kubernetes, CI/CD, Git

EXPERIENCE

SyndicateBox

April 2026 – Present

Software Engineer

- Built the newsletter platform in Next.js, TypeScript, Node.js, and Postgres/Drizzle. One codebase serves multiple regions. The largest has 1,100 subscribers at a 65% open rate.
- Wrote the automated content pipeline, from web search for local sources through drafting with Sonnet 4.6 to delivery, with schema validation and automatic retries on malformed model output.
- Shipped a self-serve ad portal on Stripe where advertisers buy placements directly. An LLM step matches each ad to the most relevant section of the next issue and inserts it automatically.

Kinary, Inc.

April 2025 – February 2026

Software Engineer (Contract)

- Built a real-time transcription prototype for 60 minute meetings using Whisper and Llama 3 with token chunking and speaker diarization, reaching 95% transcription accuracy in QA comparisons.
- Prototyped a headless browser agent (Puppeteer/Selenium) that joins scheduled Google Meets in under 30 seconds, identifies active speakers, and records audio for downstream transcription.
- Prototyped a RAG system over thousands of documents using OpenAI embeddings and OpenSearch vector indexes, retrieving relevant passages at query time to build LLM context.

eDigital

June 2023 – February 2025

Backend Python Developer

- Trained a YOLO-based screen detection model that identifies on-screen UI elements, automating data retrieval from devices so results stayed current without manual checks.
- Built an autonomous agent that drives HDMI devices through multi-screen UI flows using YOLO for perception, adapting to content that changed daily without handwritten scripts.
- Developed and maintained a custom Selenium-based library wrapper to streamline data scraping from streaming platforms, reducing client data retrieval time by 80%.

EDUCATION

CUNY – Queens College – Bachelor of Arts, Computer Science, September 2022 | Dean's List | GPA 3.83
